

FULL INTEGRATION FOR FULL SPECTRUM EFFECTIVENESS

Hospitals, secure units, pharmacies and the pharmaceutical industry entail a wide spectrum of security needs and government regulations. Staff, patients, service users and visitors require effective protection. Access to restricted areas, controlled substances and costly equipment needs to be controlled efficiently. STANLEY Security provides you with a customized and fully integrated platform.

ONE COST-EFFICIENT PLATFORM TO MINIMISE RISKS

STANLEY is an expert in integrated solutions. First we assess the risks connected to your specific tasks, operations and infrastructure. Next we design and implement your security system as an integrated whole. We make On-Site Communications, Staff Attack Alarm/Patient Call, Video Surveillance, Access Control, Intruder and Fire alarms work together seamlessly. From one single screen you can manage, monitor and maintain the entire system. The result: a cost-efficient and effective security platform to reduce risks and speed up intervention.

We can also support international businesses efficiently and effectively through the use of our centralized, cross-border International Key Account structure so you have one point of contact and centralized project management.

SAFETY FIRST: PREVENTIVE MAINTENANCE

In healthcare environments, downtime of security systems has to be avoided at all costs to minimise risk to staff, patients and assets. We have our own range of STANLEY communications systems and staff alarm systems, and we've proactively sourced vendors that can enable our teams of trained personnel to maintain and manage your security systems remotely. We believe in a proactive approach to system check-ups to prevent defects before they happen. When a problem does occur it is diagnosed remotely to increase first-time fix rates and to reduce system downtime reducing the need of technician callouts. This reduces risk, saves time and cuts the annual cost of security provision.

PERFORMANCE IN ACTION™

SECURITY SOLUTIONS FOR HEALTHCARE

INTEGRATION THAT PUTS YOU IN CONTROL

STANLEY's intuitive management software enables remote, real-time, at-a-glance control of all your security solutions across multiple sites. From one single screen you can manage, monitor and maintain mission critical systems enabling incident response time improvements, more efficient use of your security and communications budget and personnel and reduced system downtime. Through remote access by you or by STANLEY you can change configurations, giving you speed and agility to adapt to your changing environment and threat levels. Upgrades and programming changes can be broadcast remotely to minimise the risk of system failure and improve system up time to minimise the risk of loss of security coverage to your staff, patients and assets. Alarm events can be immediately managed with the addition of integrated video all from one centrally managed solution helping to provide evidence for prosecution and key information to reduce false alarms. The result: a cost-efficient and effective security platform to reduce risks and speed up intervention.

STAFF PROTECTION SYSTEMS

Violence against medical staff is a growing problem. You need to be able to assess the situation quickly and take appropriate action to protect the security and safety of your staff and other patients. By using technology such as lone worker protection systems, staff attack alarm systems, secure access control and video and audio analytics, and by linking those solutions to your paging or WIFI systems, they become your extra eyes and ears to help you respond quickly and appropriately.

SECURITY OF CONTROLLED SUBSTANCES

Pharmacies and healthcare institutions store and manage drugs and controlled substances within their premises. It is important to know these are secure and the right people have access to them and that you have a full audit trail of when the secure areas were accessed, by who and for how long. With our enterprise and campus access control systems you can fully manage and maintain access to the highly secure areas with the knowledge you are in full control. Access to areas can instantly be removed should incidents occur or real time evaluation of who is entering and exiting the secure areas. Enhanced biometric solutions can be implemented to make sure traditional card and pin based or key based access solutions are not breached. Integrating the access control solution with intruder and video gives you 24 hour, 365 day coverage to reduce the risk of internal and external theft and give you peace of mind.

ASSET MANAGEMENT: PEOPLE AND EQUIPMENT

In a time-critical environment we all know how important it is to find the right person or item as quickly as possible. Whether it is locating a porter to collect and deliver a patient or finding an item of medical equipment that may not be easily found, the STANLEY AeroScout asset management system will locate these for you in the fastest possible time, utilizing your already installed Wi-Fi network. Systems can be deployed with a minimal number of Active RFID tags and can grow with your needs to hundreds of thousands of tags across multiple sites.

ASSURE PARTNERSHIP FOR SOLUTIONS, SERVICE AND MONITORING

Through our in-house partnership program, we can finance your solution, taking the risk of ownership of your security assets on us. In return for one agreed, manageable regular payment covering all aspects of your needs, we will provide you with the very latest software and hardware product and combine it with a service and monitoring package that can be specifically tailored to meet your individual business needs – not just for now, but also for your future requirements.
